I. TECHNICAL DATA

1. MODEL PS-200C

INPUT SENSITIVITY/IMPEDANCE/ SIGNAL TO NOISE RATIO (IHF "A")	
PHONO 1 (MM)	2.5 mV/47 kohms/88 dB
PHONO 2 (MM)	2.5 mV/33, 47, 100 kohms/88 dB
PHONO 3 (MC)	0.07 mV/10 ohms/72 dB
TUNER	150 mV/47 kohms/106 dB
AUX 1/2	150 mV/47 kohms/106 dB
TAPE PLAY 1/2	150 mV/47 kohms/106 dB
OUTPUT LEVEL/IMPEDANCE	
TAPE REC 1/2	150 mV/600 ohms
OUTPUT	1.5V/600 ohms
RATED LOAD IMPEDANCE	1 kohms
PHONO MAX. INPUT LEVEL (1 kHz)	
PHONO 1/2	450 mV
PHONO 3	10 mV
FREQUENCY RESPONSE	
TUNER/AUX 1 & 2/TAPE PLAY 1 & 2	0.8 Hz to 100 kHz ± 1 dB
PHONO 1/2 (RIAA CURVE DEVIATION)	30 Hz to 15 kHz ± 0.2 dB
PHONO 3 (RIAA CURVE DEVIATION)	30 Hz to 15 kHz ± 0.2 dB
TOTAL HARMONIC DISTORTION (20 Hz to 20 kHz)	
TUNER/AUX 1 & 2/TAPE PLAY 1 & 2 (VOLUME MAX.)	0.005% at output 1V 0.002% at output 7V 0.005% at output 15V
PHONO 1/2 (VOLUME MAX.) (VOLUME -20 dB)	0.005% at output 15V 0.005% at output 1.5V
PHONO 3 (VOLUME MAX.) (VOLUME -20 dB)	0.005% at output 15V 0.005% at output 1.5V
TONE CONTROL	
BASS	± 9 dB at 100 Hz
TREBLE	± 9 dB at 10 kHz
SUBSONIC FILTER	12 dB/oct. at 18 Hz
CHANNEL SEPARATION (AUX 1/2)	70 dB (Shorted Circuit)
POWER REQUIREMENTS	
120V, 60 Hz for U.S.A. and Canada 220V, 50 Hz for Europe except UK 240V, 50 Hz for UK and Australia 110V/220V/240V, 50/60 Hz internally switchable	
DIMENSIONS	
440(W) x 90(H) x 457(D)	
WEIGHT	
7.5 kg	

2. MODEL PS-120M

RATED POWER OUTPUT	130 watts per channel, min. RMS, at 8 ohms from 20 Hz to 20 kHz with no more than 0.008% THD.
TOTAL HARMONIC DISTORTION	0.008% at rated power output
INTERMODULATION DISTORTION	0.008% at rated power output
SIGNAL TO NOISE RATIO (IHF "A")	115 dB
RESIDUAL NOISE (IHF "A"/8 OHMS)	0.2 mV
INPUT SENSITIVITY/IMPEDANCE	1V/47 kohms
DAMPING FACTOR (IHF)	350
REQUIRED LOAD IMPEDANCE	4 ohms to 16 ohms
FREQUENCY RESPONSE	DC to 100 kHz ± 0.5 dB
SUBSONIC FILTER	12 dB/oct. at 18 Hz
POWER REQUIREMENTS	
120V, 60 Hz for U.S.A. and Canada 220V, 50 Hz for Europe except UK 240V, 50 Hz for UK and Australia 110/220/240V, 50/60 Hz internally switchable	
DIMENSIONS	
44(W) x 198(H) x 459(D) mm	
WEIGHT	
30 kg	

3. MODEL PS-200M

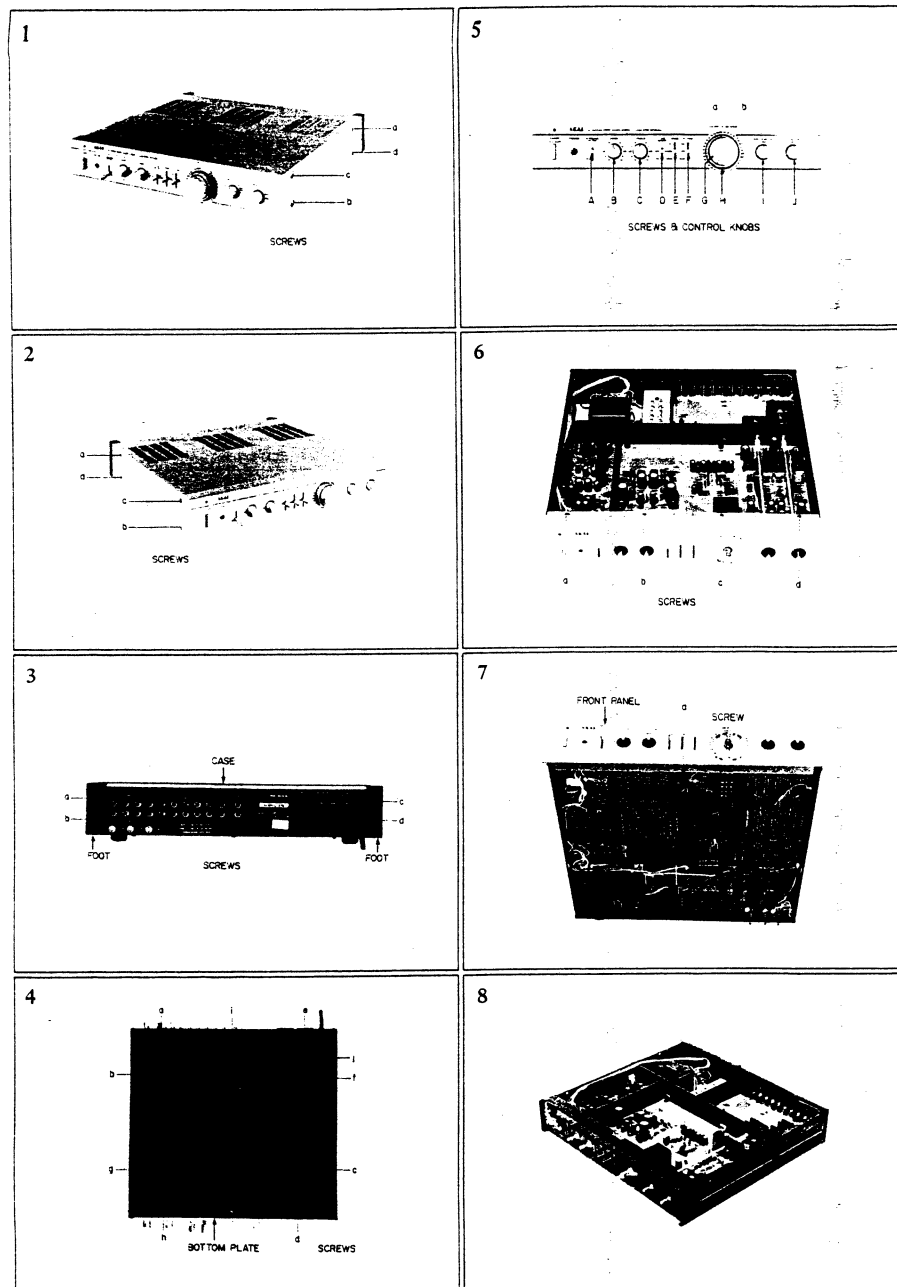

RATED POWER OUTPUT	220 watts per channel, min. RMS, at 8 ohms from 20 Hz to 20 kHz with no more than 0.008% THD.
TOTAL HARMONIC DISTORTION	0.008% at rated power output
INTERMODULATION DISTORTION	0.008% at rated power output
SIGNAL TO NOISE RATIO (IHF "A")	115 dB
RESIDUAL NOISE (IHF "A"/8 OHMS)	0.2 mV
INPUT SENSITIVITY/IMPEDANCE	1V/47 mV
DAMPING FACTOR (IHF)	350
REQUIRED LOAD IMPEDANCE	4 ohms to 16 ohms
FREQUENCY RESPONSE	DC to 100 kHz ± 0.2 dB
SUBSONIC FILTER	12 dB/oct. at 18 Hz
POWER REQUIREMENTS	
120V, 60 Hz for U.S.A. and Canada 220V, 50 Hz for Europe except UK 240V, 50 Hz for UK and Australia 110/220/240V, 50/60 Hz internally switchable for other countries.	
DIMENSIONS	
440(W) x 198(H) x 459(D) mm	
WEIGHT	
30 kg

V. CIRCUIT OPERATION

1. MODEL PS-200C

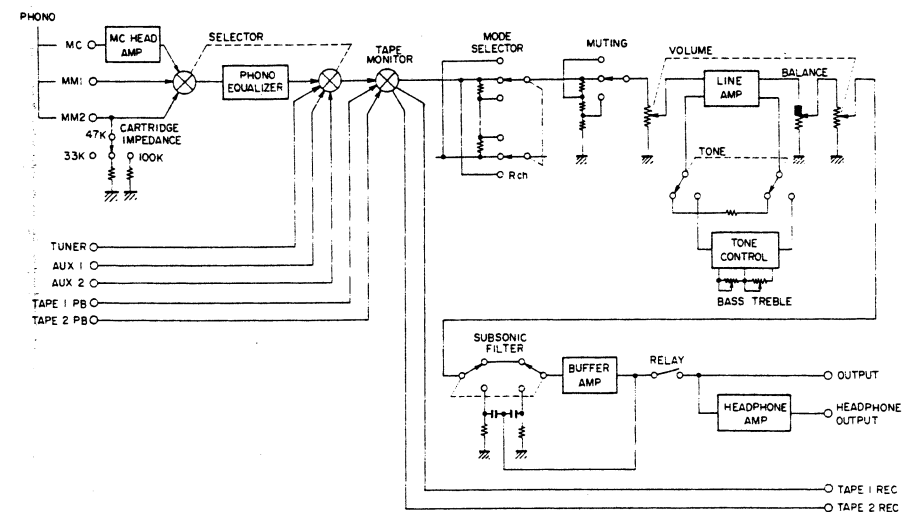

Fig. 9 Block Diagram (L Channel Only)

1) MC Head Amp

MC PHONO input's reference input is a low 0.07 mV. Therefore, a gain of approximately 30 dB at 1 kHz is obtained from the Head Amp to make the Equalizer Amp input equal to the MM type input. The circuit is made up of high h_{fe} , low noise transistors connected in parallel to obtain high gain in the first stage. The pure complimentary push-pull last stage uses transistors with good linearity. The dynamic range of the Head Amp deserves attention. The Head Amp is a flat amp with no RIAA characteristics, unlike the Equalizer Amp. The output of the cartridge increases with frequency with 1 kHz as reference. For this reason, even if sufficient dynamic range is obtained in the low and mid frequencies, there may be clipping in the high frequency. It is therefore necessary that the Head Amp does not saturate at the level at least where clipping occurs in the Equalizer Amp. The maximum allowable input voltage of this model is 10 mV at 1 kHz.

2) Equalizer Amp

The circuit is composed of a differential amplifier with cascade connected low noise one-chip dual FET in the first stage. Also, by using a constant current power source as a common source, CMRR (Common Mode Rejection Ratio) is improved. Distortion is also circumscribed by the differential amplifier in the next stage. The last stage is a Darlington connected pure complimentary push-pull circuit. The NFB type equalizer features a stable frequency response and receives very little influence from heat, etc. By using a high precision part for the equalizer element, RIAA deviation is held within ± 0.2 dB from the standard value with frequency response range of 30~15 kHz for this model. The circuit operation of the differential amplifier in the first stage is described below. The circuit is shown in Fig. 10. TR1a is connected in series to TR2 and TR1b is connected in series to TR3. Also a constant voltage is applied to the common gate of TR2 and TR3 from the resistance

2. MODEL PS-120M and PS-200M

Fig. 11 Block Diagram

1) Input Circuit

These models are equipped with two terminals, DC and NORMAL, for input. By using the "DC" input, they become DC amplifiers without input coupling condenser. By using the "NORMAL" input, the coupling condenser cuts off the DC part. Also when the Subsonic Filter Switch is turned ON, the low range of 18 Hz or less is reduced by 12 dB/oct.

2) DC Power Amplifier Circuit

The signal from the input circuit passes the Input Level Control and enters the DC amplifier system's Power Amplifier Input. To explain what is meant by the DC amplifier system: Condensers are used in circuits to obtain certain characteristics for DC operation, AC gain, and impedance when making an amplifier. However, condenser reactance increases in reverse proportion to the signal frequency and ultra low signals cannot be handled in AC. In circuit using many condensers, condenser reactance can be thought of as 0 in the midrange signals but in the ultra low range, condenser

reactance is thought of as unlimited. When the midrange and the ultra low range equivalent circuits are compared; the gain, input and output impedances at each stage, and distortion, etc., changes widely.

In DC amplifiers, the condensers in the circuits, as above, are all removed. The same amplitude and impedance, etc., can be obtained in DC or AC in this design. In addition, the first stage differential transistor, FET pairing, and temperature balance, etc., becomes absolute necessity in the DC amplifiers. Next, although circuit-constructed, cascade connected differential amplifier used in PS-200C is used for the first stage. The voltage gain is obtained from the transistor differential amplifier in the next stage, and the input to the next stage is obtained from each collector.

The signals from the TR10 and TR11 collectors pass the pure complimentary push-pull TR19 and 20 and TR21 and 22, respectively. They are current amplified by the parallel push-pull power transistors and connected to SP OUT.

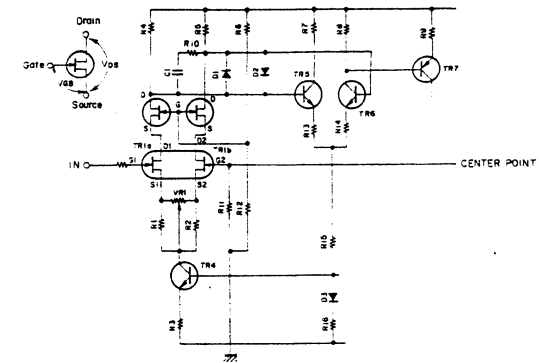

Fig. 10 Input Circuit of The Differential Amplifier

split of R6 and R12 regardless of the input signal.

The circuit is cascade connected in this way and a one-chip dual FET is used for TR1.

These circuits have advantages such as DC drift decrease, current noise decrease and improvement in frequency response characteristics.

Then the gate potential of TR1a increases, the impedance between TR1a drain and source decreases, and the drain current increases. Since TR1 is made up of dual FET differential amplifier, TR1b drain current decreases proportionately to TR1a drain current increase. This causes TR1a drain potential to decrease and TR1b drain potential to increase. Since TR2 and TR3 gate potentials are constant, TR2 and TR3 V_{GS} vary due to changes in TR1a and TR1b drain potentials. TR2 drain current increases and TR3 drain current decreases due to this variance.

When the gate potential of TR1a decreases, the impedance between TR1a drain and source increases and the drain current decreases. TR1b drain current thereby increases proportionately to TR1a decrease. TR1a drain potential increases and TR1b drain potential decreases as a result. On the other hand TR2 V_{GS} decreases and TR3 V_{GS} increases to increase the TR2 drain potential by TR2 drain current decrease and to decrease the TR3 drain potential by the TR3 drain current increase.

In other words, TR1a gate signal input appears in reverse phase, equal voltage signal at R4 and R5 load resistors. This signal enters between the TR5 and TR6 bases as differential amplifier inputs of those two. By this, the output between the two drains in the first stage becomes a push-pull operation, and the distortion is minimized.

Since the circuit structure is two differential amplifiers used together, total CMRR is a product of the first stage CMRR and the second stage CMRR.

Even if there is an increase in the drain current, or an in-phase input due to noise, etc., any collector potential change is held down to result in a stable center potential and a decreased DC drift.

The output from the second stage differential amplifier is an unbalanced type taken out only from the TR6 collector. It is phase inverted in the next stage and pulls out the equalizer amplifier output signal as a push-pull circuit.

3) Line Amplifier

This circuit is almost exactly the same circuit-constructed flat amplifier as the equalizer amplifier without the NFB equalizer circuit. By equipping interlocking volumes on the input and the output sides, S/N ratio is improved when the volume is turned low.

4) Output Circuit

The output from the line amplifier passes the balance control, volume control, subsonic filter switch and is supplied to the buffer amplifier.

The buffer amplifier is an impedance conversion circuit used to prevent crossing between the circuit. Consequently, it requires high input impedance, low output impedance, no distortion, wide dynamic range, flat frequency response characteristics and low noise, etc. These are fulfilled in this model by using the pure complimentary SEPP type emitter follower circuit.

Fig. 12 Pre Driver Circuit

3) Pre Driver Circuit (Refer to Fig. 12)

The negative phase signals from the first stage differential amplifier (refer to PS-200C circuit explanation) enter the bases of TR6 and TR7 and the negative phase outputs from each collector become base inputs to the transistors of the next stage. Although the signal from the TR7 collector becomes the base input of TR10, the signal from the TR6 collector must become TR11 base input to have the push-pull circuitry. Voltage between two sides of R17 (1.8 k) is supplied to TR10 base bias. TR8 is biased by voltage between two sides of R16 (1.8 k) + D1 and is supplied with IC8. And since V_{BE} of TR8

is approximately the same voltage as the D1 voltage drop, R21 (1.8 k) is supplied with the same voltage as the voltage between two sides of R16 = R17 (1.8 k). This IC8 passes the cascade connected TR9 and flows to R25 (1.8 k). Since R21 and R25 resistor values are equal, TR11 base is supplied with an equal potential bias as the TR10 base. As explained above, TR7 collector signal enters the TR10 base, TR6 collector signal appears in the voltage between two sides of R25 as a change in IC8 and enters TR11 base after which it is passed to the next stage by the push-pull circuitry.

Fig. 13

4) Over Current Protection Circuit (Refer to Fig. 13)

When the speaker terminal of the power amplifier is shortcircuited or when the load impedance equivalently becomes too low due to too many speaker connections, the output stage transistor breaks down because of excessive power consumption by the transistors or of excess current. The circuit shown in Fig. 13 composed of TR15 and 17 and TR16 and 18 prevents this damage. TR15 and 17 circuit operates for excessive + signal current and TR16 and 18 operate for excessive - signal.

The case when there is a current overflow of + signal will be explained here. Ordinarily, TR15 base potential and the emitter potential are almost equal and TR15 is OFF. When the load R_L becomes lower than the power amplifier's specified load or is short-circuited, excess current flows to the output stage transistor. This causes the base potential of TR15 to become greater than the emitter potential and TR15 turns ON.

When this happens, the signal to TR19 passes D8 and R40 and is dropped to the center (node) point. The output stage transistor, therefore, stops receiving the signal and the excess current does not flow.

Also when TR15 is turned ON, TR17 base potential is decreased to turn on TR17. TR15 base potential is thereby further increased to make the operation fullproof. Also when TR15 is turned ON, relay RL1 (see Fig. 14) turns OFF and the power amplifier output is disconnected from the speaker.

TR16 and 18 operate in the same way for excess signal current to protect the output stage transistor.

5) Power Limiter Circuit (Refer to Fig. 13)

This circuit is to protect the output stage transistor at excessive input. When the input signal voltage to TR19 and TR20 exceeds a certain point, it is limited and prevents excessive input to the output stage transistor. Only the case of positive signal input will be explained here.

There is very little voltage amplification because TR19, TR21, and the output stage transistor are emitter followers at current amplification. In other words, the TR19 base is supplied with the same voltage as speaker output voltage. So the maximum voltage to appear at the output is $+V_{CC}$. Signals with voltage of no less than approximately 2.1V or 3 diode voltage drops less than this $+V_{CC}$ are limited by TR13, D4, and D6.

To explain the circuit operation, first, $+V_{CC}$ is added to the TR13 collector. The voltage between TR13 collector and emitter has a potential of 5 diode voltage drops or approximately 3.5V according to the design, and a voltage 3.5V lower than C901 positive voltage appears at the emitter.

Next, taking a look at the signal voltage, we find that when the value after subtracting the voltage drops of D4 and D6 (approximately $0.7V \times 2$) is greater than TR13 emitter potential, the signal passes R38 and is grounded to be limited. By the above operation, when there is a voltage no less than the value approximately 2.1V (Voltage drops of D4 and D6 subtracted from TR13 V_{CE}) less than $+V_{CC}$, the signal passes D4→D6→R38 and is grounded to limit the output.

Fig. 14

6) Mute Circuit (Refer to Fig. 14)

When the power of the amplifier is turned on or off, pop and distortion noise generate to damage the speakers or produce unpleasant sound. The mute circuit of Fig. 14 prevents these.

When the power is ON, point A is supplied with a diode rectified negative pulse current and charges C44 through R101. While C44 is being charged, TR34 base is supplied with the potential from +V_{CC} and turns ON. On the other hand, TR35 base potential decreases to turn OFF. At this condition since TR35 collector current does not flow to R95, TR36 base potential becomes higher than the emitter potential and TR36 is turned ON. When TR36 is turned ON, collector current flows through R100 and R95 and the PROTECTION INDICATOR D1 illuminates. When C44 is finished being charged, TR34 base becomes negative potential and TR34 turns off. Then the base current of TR35 turns on TR35 after charging the time constant circuit. Relay RL1 is driven by the TR35 collector current and the main amplifier output is connected to the speaker output. In this conditions, TR36 emitter potential becomes higher than the base potential so that TR36 turns OFF and the Protection Indicator D1 lights off.

When the power is OFF, point A is not supplied with the pulse current.

The C44 charge, therefore, discharges through R99 and raises the base potential of TR34 to turn ON TR34. TR35 base potential then decreases to turn off TR35 and the relay RL1 also turns off. When the TR35 collector current stops flowing, TR36 base potential becomes higher than the emitter potential and turns ON to light the PROTECTION INDICATOR D1. However, since the potential of +V_{CC} gradually decreases, TR36 base potential decreases to

turn OFF and the PROTECTION INDICATOR D1 also turns off.

7) Center (node) Point Voltage Detection Circuit (Refer to Fig. 14)

When there is DC potential at the power amplifier's speaker output terminal, the DC will flow to the speaker in the case of OCL circuitry and damage the speakers. For this reason, when there is a DC potential, a circuit is necessary to detect the potential to turn off the mute circuit relay RL1 and cut off the speaker from the power amplifier output. This circuit is called a center (node) point voltage detection circuit and is shown in Fig. 14.

Ordinarily the center (node) point is 0V and TR32 and 33 are OFF. C41 is a non-pole condenser and is grounded that there is no effect from the AC signal. But when there is a positive DC potential at the center point, that potential positively charges C41 on the side opposite to the ground. Consequently, TR32 is base biased and is turned ON. TR31 base becomes ground potential and TR31 turns ON. When TR31 turns ON, TR34 base potential is increased, TR34 turns ON, and TR35 base potential decreases. When TR35 is turned OFF, relay RL1 turns OFF and the power amplifier output is disconnected from the speakers.

Next, if there is a negative DC potential at the center point, that potential negatively charges C41 on the opposite side to the ground and TR33 emitter potential becomes lower than the base potential to turn ON TR33. Accordingly, TR31 base becomes ground potential and relay RL1 turns off as mentioned earlier and the power amplifier is cut off from the speaker.

Fig. 15 Meter Amplifier and LED Drive Circuit

Fig. 16 LB1405 Block Diagram

8) Meter Amplifier and LED Drive Circuit (Refer to Fig. 15, 16)

The signal from the speaker output enters the input of Meter Amplifier IC1 and comes out of terminals 2 and 8 as output. The peak meter used in these models requires approximately 40 mA of electric current. Since the output current from IC1 is not enough, the output from IC1 is current amplified by the TR4 emitter follower circuit to drive the meter. Also because of the large current, constant voltage circuit, TR1 and TR2, supplies the current. TR3 equalizes TR4 V_{BE} and TR3 V_{BE} and equalizes V_{BE} changes due to base current changes for good

linearity to the meter input.

D4 assists in obtaining good linearity of the meter itself. When the signal voltage increases to a certain point, D4 provides continuity to increase the meter drive current and compensates the linearity.

IC LB1405 is used for the LED drive. Fig. 16 shows the block diagram. The signal entering terminal 3 is amplified and is passed to each comparator. A resistance divided constant voltage for each level is supplied to one side of the comparators. The IC compares each input signal with this constant voltage and detects it to drive the LED of each level.

Fig. 17

Fig. 18

Fig. 19

9) L1 and R65 Operation (Refer to Fig. 17 to 19)

As shown in Fig. 17, most amplifiers have an inductance or a resistor between the output and the speaker. The inclusion has several advantages.

Considering the negative effect when L and R is inputted, we find that the power amplifier output impedance increases higher the frequency in the case of inductance. This negative effect is shown in Fig. 18. However, as can be seen in the figure, the effect of the inductance is merely 0.014 ohm at 1 kHz and 1.4 ohm even at 100 kHz, and is hardly a problem.

Considering the positive side, we find that the impedance seen from the load terminal becomes extremely low at high frequencies due to such factors as speaker cord capacitive components and L-C networks for speaker frequency divider. However,

the load impedance seen from the power amplifier output can maintain a value above a certain level due to the effect from L and R added in series to the load terminal.

Also the addition of L and R serves as a buffer when the power amplifier begins high range oscillation as a result of poor grounding of the Pin jack or phase difference caused by capacitance load at the output stage, etc. When something with a capacitance component is connected to the load in this way, a series resonance circuit is constructed as in Fig. 19(a) and the load impedance becomes 0 at the resonance point. But because of the operation of R connected parallel to L, the resonance circuit is damped and looks as if a pure resistor has been added equivalently as in Fig. 19(b), and the load impedance does not become zero even at the resonance point.

10	L ch LED Sensitivity Adjustment	AC Voltmeter between L ch SP OUT \oplus and \ominus	VR2 2.2 kB (Meter P.C Board)	Input 1 kHz sine wave, control the output level with the input level, and adjust VR2 so that 0 dB LED will go on at SP output of 31.0V (120W) and off at 28.3V (100W). Refer to NOTE 4.	
11	R ch Meter Sensitivity Adjustment	AC Voltmeter between R ch SP OUT \oplus and \ominus	VR1b 1 kB (Meter P.C Board)	Meter indicates 120 W	Input 1 kHz sine wave & adjust the input level until the AC Voltmeter reads 31.0 V. Refer to NOTE 4.
12	R ch LED Sensitivity Adjustment	AC Voltmeter between R ch SP OUT \oplus and \ominus	VR1b 2.2 kB (Meter P.C Board)	Input 1 kHz sine wave, control the output level with the input level, and adjust VR2 so that 0 dB LED will go on at SP output of 31.0V (120W) and off at 28.3V (100W). Refer to NOTE 4.	

Chart-2

- NOTES:**
1. Connect and disconnect a measuring equipment only after the power has turned off for several seconds.
 2. When connecting the Voltmeter for Steps 1, 2, 5 and 6, do not shortcircuit positive and negative power sources.
 3. When connecting the DC Ammeter for Steps 4 and 8, do not touch the angle fixing the P.C Board.
 4. Do adjustments in steps 9 to 12 with the input in only one channel.

3. MODEL PS-200M (Refer to Figs. 23, 24)

Step	Adjustment Item	Measuring Instrument Connection	Adjustment Point	Result	Remarks
1	L ch -DC Power Supply Voltage Adjustment	DC Voltmeter or Digital Voltmeter between R79 and Ground	VR4 10 kB (Main Amp P.C Board (L))	-73.0 V	Refer to NOTE 2.
2	L ch +DC Power Supply Voltage Adjustment	DC Voltmeter or Digital Voltmeter between R77 and Ground	VR3 10 kB (Main Amp P.C Board (L))	+73.0 V	Refer to NOTE 2.
3	L ch Center Off-set Voltage Adjustment	DC Voltmeter or Digital Voltmeter between L ch SP OUT \oplus and \ominus	VR1 1 kB (Main Amp P.C Board (L))	0 ± 0.5 mV	OK if 0 ± 0.5 mV at the beginning of adjustment
4	L ch Idling Current Adjustment	DC Ammeter or Tester between P15 \oplus and \ominus	VR2 1 kB (Main Amp P.C Board (R))	20 mA	Refer to Fig. 7 and NOTE 3.
5	R ch -DC Power Supply Voltage Adjustment	DC Voltmeter or Digital Voltmeter between R79 and Ground	VR4 10 kB (Main Amp P.C Board (R))	-73.0 V	Refer to NOTE 2.
6	R ch +DC Power Supply Voltage Adjustment	DC Voltmeter or Digital Voltmeter between R77 and Ground	VR3 10 kB (Main Amp P.C Board (R))	+73.0 V	Refer to NOTE 2.
7	R ch Center Off-set Voltage Adjustment	DC Voltmeter or Digital Voltmeter between R ch SP OUT \oplus and \ominus	VR1 220 B (Main Amp P.C Board (R))	0 ± 0.5 mV	OK if 0 ± 0.5 mV at the beginning of adjustment
8	R ch Idling Current Adjustment	DC Ammeter or Tester between P14 \oplus and \ominus	VR2 1 kB (Main Amp P.C Board (R))	20 mV	Refer to Fig. 7 and NOTE 3.
9	L ch Meter Sensitivity Adjustment	AC Voltmeter between L ch SP OUT \oplus and \ominus	VR1 1 kB (Meter P.C Board)	Meter indicates 200 W	Input 1 kHz sine wave & adjust the input level until the AC Voltmeter reads 40.0 V. Refer to NOTE 4.
10	L ch LED Sensitivity Adjustment	AC Voltmeter between L ch SP OUT \oplus and \ominus	VR2 2.2 kB (Meter P.C Board)	Input 1 kHz sine wave, control the output level with the input level, and adjust VR2 so that 0 dB LED will go on at SP output of 40.0 V (200W) and off at 35.8V (160W). Refer to NOTE 4.	
11	R ch Meter Sensitivity Adjustment	AC Voltmeter between R ch SP OUT \oplus and \ominus	VR1b 1 kB (Meter P.C Board)	Meter indicates 200 W	Input 1 kHz sine wave & adjust the input level until the AC Voltmeter reads 40.0 V. Refer to NOTE 4.

Step	Adjustment Item	Measuring Instrument Connection	Adjustment Point	Result	Remarks
12	R ch LED Sensitivity Adjustment	AC Voltmeter between R ch SP OUT \oplus and \ominus	VR2b 2.2 kB (Meter P.C Board)	Input 1 kHz sine wave, control the output level with the input level, and adjust VR2 so that 0 dB LED will go on at SP output of 40.0 V (200 W) and off at 35.8V (160W). Refer to NOTE 4.	

Chart-3

- NOTES:**
1. Connect and disconnect a measuring equipment only after the power has turned off for several seconds.
 2. When connecting the Voltmeter for Steps 1, 2, 5 and 6, do not shortcircuit positive and negative power sources.
 3. When connecting the DC Ammeter for Steps 4 and 8, do not touch the angle fixing the P.C Board.
 4. Do adjustments in steps 9 to 12 with the input in only one channel.

VIII. CLASSIFICATION OF VARIOUS P.C BOARDS

1. P.C BOARD TITLES AND IDENTIFICATION NUMBERS

1) Model PS-200C

P.C Board Title	P.C Board Number
Selector P.C Board	PC-2001
Pre Amp P.C Board (Old Type)	PC-2002
Pre Amp P.C Board (B) (New Type)	PC-2056
Power Supply P.C Board	PC-2003
Impedance Selector P.C Board	PC-2033
LED P.C Board (B)	PM-1252
Fuse P.C Board (U) (U/T)	PC-2004
Fuse P.C Board (C) (CSA, AAL)	PC-2034
Fuse P.C Board (E) (CEE, UK)	PC-2035

Chart-4

2) Model PS-120M

P.C Board Title	P.C Board Number
Main Amp P.C Board (L)	PM-1201
Main Amp P.C Board (R)	PM-1202
Filter P.C Board	PM-1203
Meter P.C Board	PM-1204
Temp Compensation P.C Board	PM-1249
LED P.C Board (A)	PM-1250
LED P.C Board (B)	PM-1252
Fuse P.C Board (U) (U/T)	PM-1205
Fuse P.C Board (C) (CSA, AAL)	PM-1248
Fuse P.C Board (E) (CEE, UK)	PM-1251
Relay Terminal P.C Board	PM-1247

Chart-5

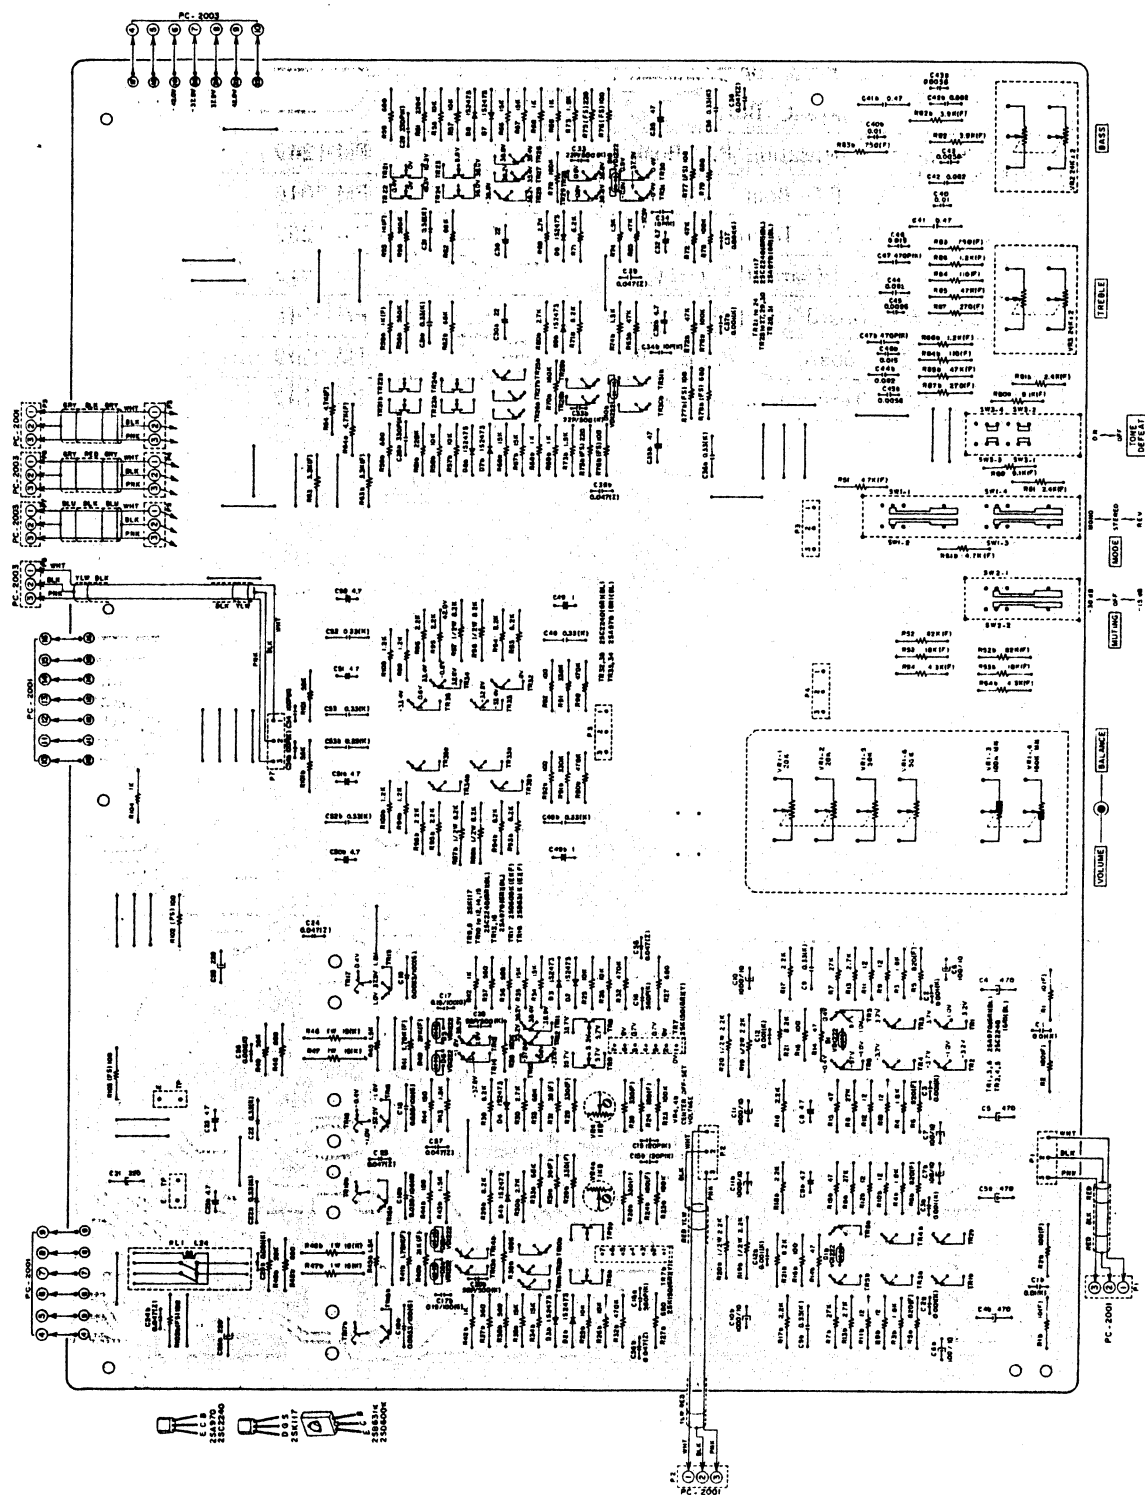

3) Model PS-200M

P.C Board Title	P.C Board Number
Main Amp P.C Board (L)	PM-1201
Main Amp P.C Board (R)	PM-1202
Filter P.C Board	PM-1203
Meter P.C Board	PM-2001
Temp Compensation P.C Board	PM-1249
LED P.C Board (C)	PM-2016
LED P.C Board (B)	PM-1252
Fuse P.C Board (U) (U/T)	PM-2017
Fuse P.C Board (C) (CSA, (AAL)	PM-2018
Fuse P.C Board (E) (CEE, UK)	PM-2019
Relay Terminal P.C Board	PM-1247

Chart-6

2. MODEL PS-200C COMPOSITION OF VARIOUS P.C BOARDS

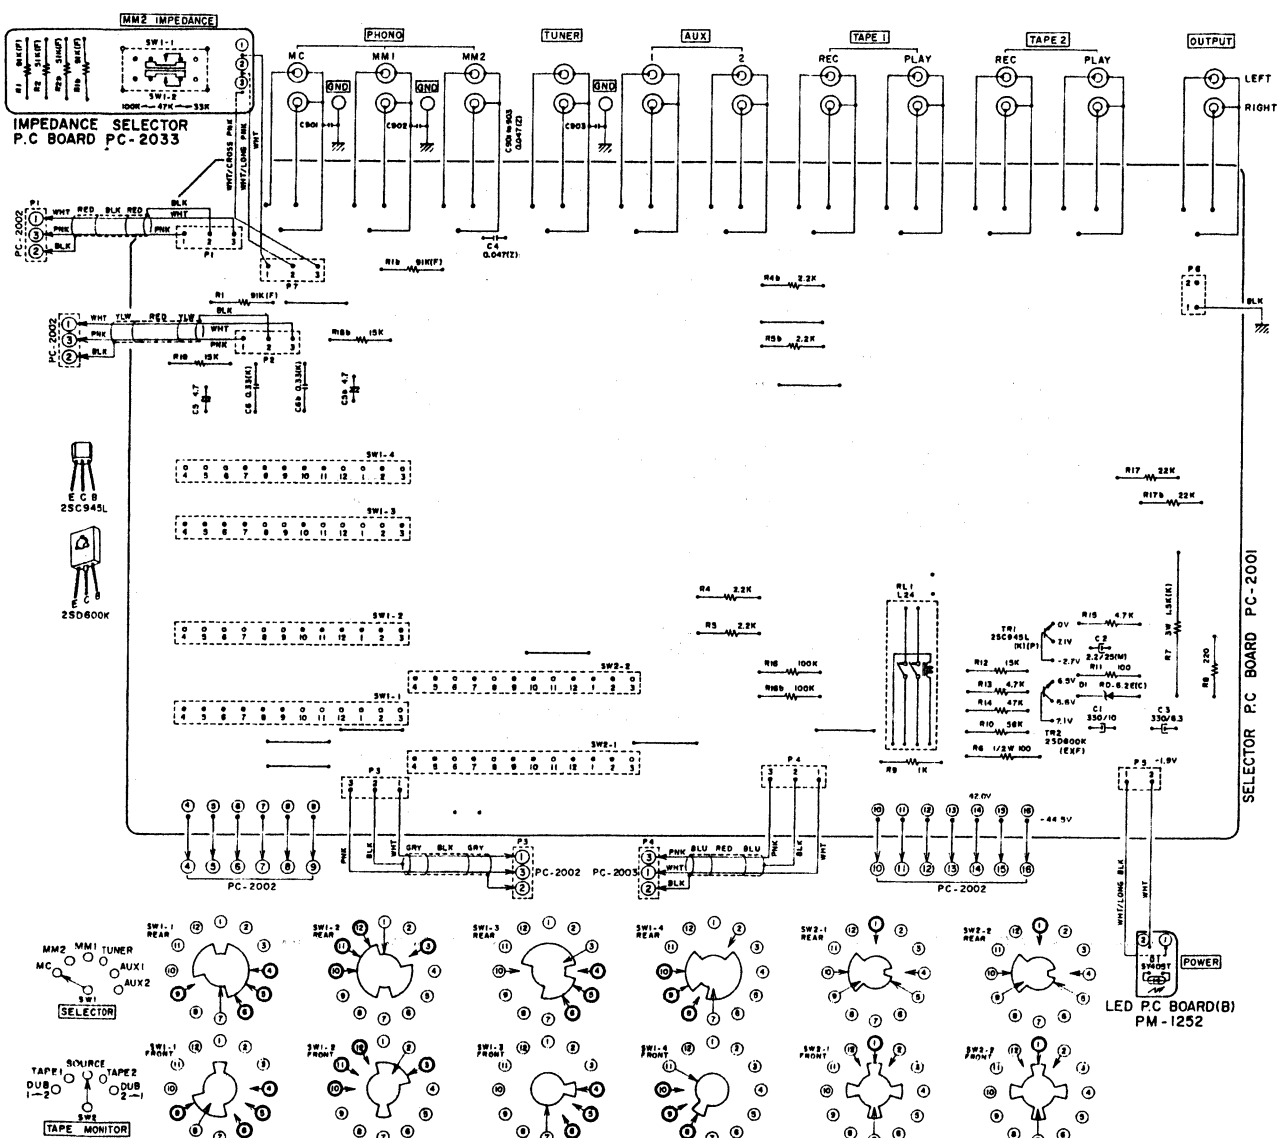

1) PRE AMP P.C BOARD PC-2002 (Old Type)

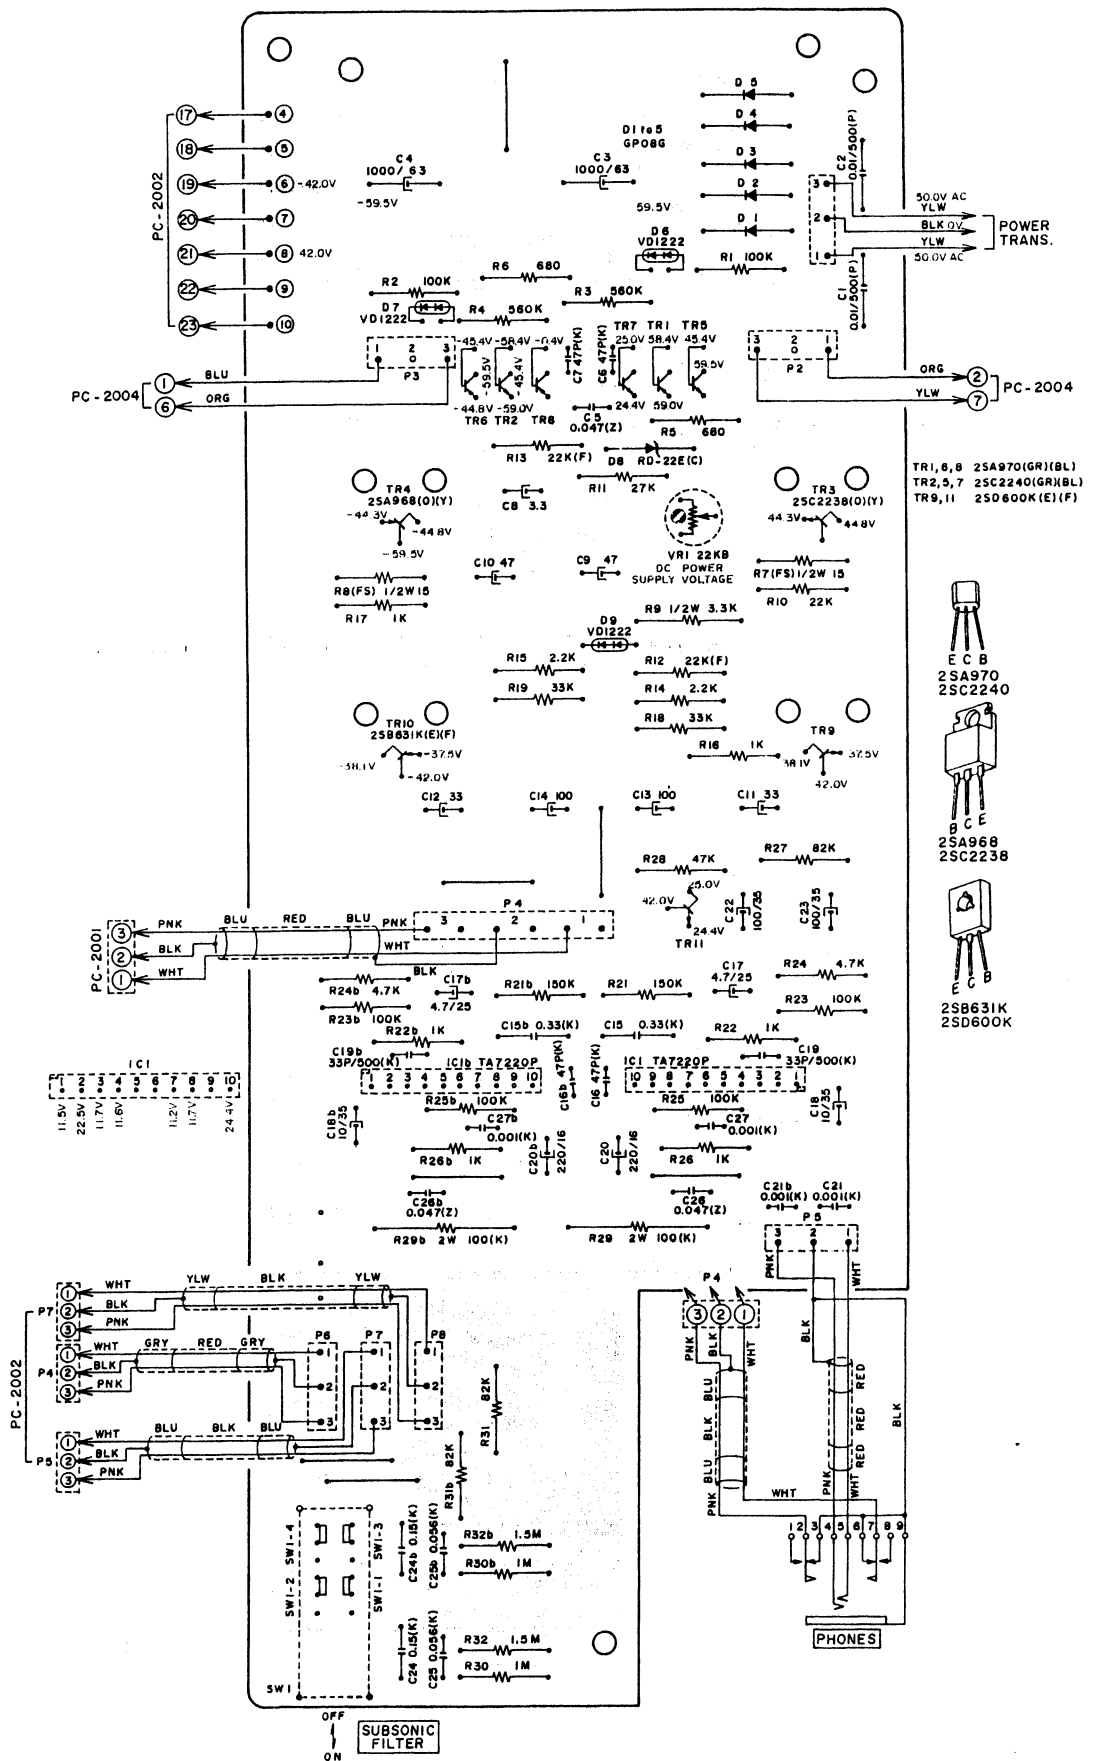

2) PRE AMP P.C BOARD (B) PC-2056 (New Type)

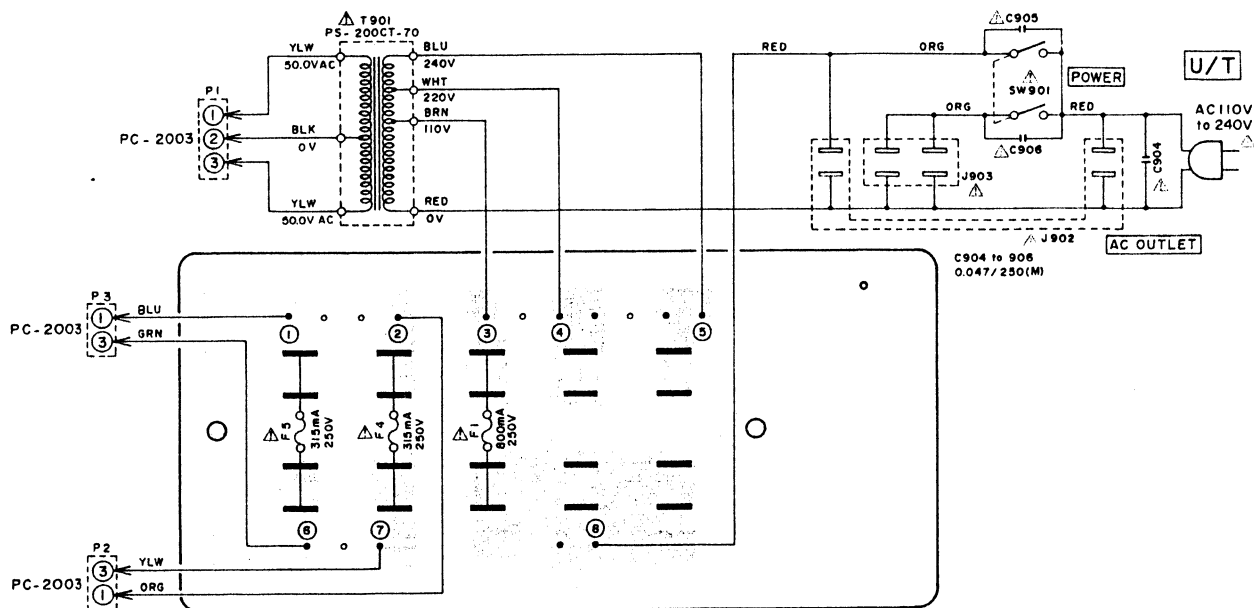

3) SELECTOR P.C BOARD PC-2001, IMPEDANCE SELECTOR P.C BOARD PC-2033 AND LED P.C BOARD (B) PM-1252

4) POWER SUPPLY P.C BOARD PC-2003

5) FUSE P.C BOARD (U) PC-2004 (U/T)

IV. INDEX

1. MODEL PS-200C	83
2. MODEL PS-120M	84
3. MODEL PS-200M	85

Resistor and Capacitor which is not listed in this parts list, please refer to COMMON LIST FOR SERVICE PARTS.

HOW TO USE THIS PARTS LIST

1. This parts list is compiled by various individual blocks based on assembly process.
2. When ordering parts, please describe parts number, serial number, and model number in detail.
3. How to read List

The reference number corresponds with illustration or photo number of that particular parts list.

This number corresponds with the Figure Number.

This number corresponds with the individual parts index number in that figure.

A small "x" indicates the inability to show that particular part in the Photo or Illustration.

Schematic Diagram Number of individual manufactured part.
(not required for parts order)

Quantity of particular part required.

Ref. No.	Parts No.	Description	Schematic No.	Q'ty
FLYWHEEL BLOCK #13				
12-115x	800425	Flywheel Block Assy. Comp. RDG #13	1	1
12-116	244506	Flywheel Only	RD-233	1
12-117x	244754	Felt, Flywheel	RD-275	1
12-118	251324	Main Metal Case	RD-236	1
12-119	253080	Main Metal	RD-237	1

4. The symbol numbers shown on the P.C. Board list can be matched with the Composite Views of Components of the Schematic Diagram or Service Manual.
5. Please utilize separate "Common List for Service Parts" for Resistor Parts orders.
6. The shape of the parts and parts name, etc. can be confirmed by comparing them with the parts shown on the Electrical Parts Table of P.C. Board.
7. Both the kind of part and installation position can be determined by the Parts Number. To determine where a parts number is listed, utilize Parts Index at end of Parts List.
It is necessary first of all to find the Parts Number. This can be accomplished by using the Reference Number listed at right of parts number in the Parts Index. (meaning of ref. no. outlined in Item 3 above).
8. Utilize separate "Price List for Parts" to determine unit price. The most simple method of finding parts Price is to utilize the reference number.

CAUTION: 1. When placing an order for parts, be sure to list the parts no., model no., and description. There are instances in which if any of this information is omitted, parts cannot be shipped or the wrong parts will be delivered.

2. Please be careful not to make a mistake in the parts no. If the parts no. is in error, a part different from the one ordered may be delivered.

3. Because parts number and parts unit supply in the Preliminary Service Manual (Basic Parts List) may be partially changed, please use this parts list for all future reference.

WARNING: Δ INDICATES SAFETY CRITICAL COMPONENTS. FOR CONTINUED SAFETY, REPLACE SAFETY CRITICAL COMPONENTS ONLY WITH MANUFACTURER'S RECOMMENDED PARTS.

AVERTISSEMENT: Δ IL INDIQU LES COMPOSANTS CRITIQUES DE SURETE. POUR MAINTENIR LE DEGRE DE SECURITE DE L'APPAREIL NE REMPLACER LES COMPOSANTS DONT LE FONCTIONNEMENT EST CRITIQUE POUR LA SECURITE QUE PAR DES PIECES RECOMMANDEES PAR LE FABRICANT.

AC INLET SYSTEM

This model is equipped with an AC INLET SYSTEM. Please refer to the AC INLET SYSTEM CHART below for the specific type. By the AC INLET SYSTEM, AC (mains) cord can be connected to and disconnected from the model because the model is provided with socket exclusively for AC (mains) cord on its main body. Please note, however, that certain models are not equipped with this system and has a built-in AC (mains) cord as before.

II. MODEL PS-120M

1. RECOMMENDED SPARE PARTS LIST

Because, if the parts listed below are on hand, almost any repair can be accomplished, we suggest that you stock these Recommended Spare Parts Items.

Parts No.	Description	Note
BA311438	Filter P.C Board Comp. PS-120M	
BA311432	Main Amp P.C Board (L) Comp. PS-120M	
BA311436	Main Amp P.C Board (R) Comp. PS-120M	
BA311440	Meter P.C Board Comp. PS-120M	
BT311862	△ Power Trans. PS-120MT-30	(CSA)
BT311860	△ Power Trans. PS-120MT-40	(CEE, UK)
BT311859	△ Power Trans. PS-120MT-70	(U/T)
EC311688	Elect./C. 10000μF 71WV	
ED311794	LED SY40ST	
ED311857	LED TLR114	
ED300924	Silicon Diode GP08D	
ED311849	Silicon Diode SS-3A	
ED311851	Silicon Diode SS-3AR	
ED311852	Silicon Diode 1S2471	
ED624903	Silicon Diode 1S2473	
ED490511	Varistor VD1222	
ED311854	Zener Diode RD-11E (C)	
ED311752	Zener Diode RD-22E (C)	
ED311864	Zener Diode RD-3.3E (C)	
ED311853	Zener Diode RD-6.2E (C)	
EF303348	△ Fuse ST-6 6.3A	(CSA)
EF308847	△ Fuse 1.6A 125V	(CSA)
EF311839	△ Fuse 1.6A 250V	(U/T)
EF305703	△ Fuse 630mA 125V	(CSA)
EF306124	△ Fuse 630mA 250V	(U/T)
EF300577	△ Fuse (EAK) 5AT	(CEE, UK)
EF623103	△ Fuse (SEMKO T) 1AT	(CEE, UK)
EF691007	△ Fuse (SEMKO T) 3.15AT	(U/T)
EF668474	△ Fuse (SEMKO T) 400mAT	(CEE, UK)
EF242605	△ Fuse (SEMKO T) 6.3AT	(U/T)
EI311855	IC LB1405	
EI308865	IC TA7318P	
EL311833	Lamp (Cord Type) 8V 300mA (200mmx2)	
EM311863	Meter KL-65L-100	
EP311858	Relay MSJ48D2-0Z	
ES311805	△ Lever SW. SY02-2 (U85DMU, C)	(U/T, CSA)
ES311806	△ Lever SW. V8SDV	(CEE, UK)
ES311690	Push SW. J-K2014	
ET302465	FET 2SK117 (SPECIAL)	
ET311792	FET 2SK150 (GR) (Y)	
ET557965	Transistor 2SA733 (Q) (R)	

When ordering parts, please describe Parts Number, Description, and Model Number in detail.

Parts No.	Description	Note
ET311845	Transistor 2SA899 (B) (V)	
ET311844	Transistor 2SA949 (O) (Y) AKAI	
ET311791	Transistor 2SA968 (O) (Y)
